VOIDFORGE trial kit: do it once by hand, with a stopwatch

WARNING: THIS IS A PRACTICE RUN. Never use these words for real money. Destroy the sheets after. Use practice dice and cards only.

1. What to print

From `vfmethod/`, on Letter paper (A4 files in brackets):

- `forge-sheet.pdf` (3 pages: sheets D, C and E) [A4: `forge-sheet-a4.pdf`]
- `bip39-binary-table.pdf` (4 pages) [A4: `bip39-binary-table-a4.pdf`]

Print single-sided, at 100% (no "fit to page"). This is the 12-word version.

2. What you need

- Two matching d6 (or one die thrown twice) and a cup
- One 52-card deck
- A pen
- A timer or stopwatch
- About 45 minutes, in one sitting

3. Timing table

Press start when you begin a step; write the clock time. Estimates are from design-notes.md (12 words, one person).

Step	Est. min	Start	End	Minutes
D1 Dice pairs	7			
D2 Dice bias box	1			
D3 Marks R, M	1.5			
D4 Seed XOR (skip)	optional			
C1 3 shuffles	4.25			
C2 Deal and play	7.25 (with C3)			
C3 Neighbors, 1s count	while dealing			
C4 Marks R, M	1.5			

Step	Est. min	Start	End	Minutes
E1 XOR	2.5			
E2 Forge seal	2			
E3 Words	3			
E4 Word check	2			
E5 Last word, identity	4			
E6 Backup copy	2			
Total	**about 39**			

Setup (about 1 min) is not in the table. Count your dice throws (about 29 expected): _____

4. How to check your result

A. Reference script. Put your dice pairs (in the order thrown, *including* "again" pairs) and your cards (in dealt order, one string per deck) into a JSON file, for example `mine.json`:

```
{ "words": 12, "dice": "14 15 26 53 ...", "cards": ["7H KC TS 2D ...", "...", "..."] }
```

Run, from `vfmethod/`: `node ref/forge.js mine.json [--md out.md] [--json out.json]`. It prints the grids, marks and words to compare with your sheets. Or send me the photos or the values and I will run it.

B. Two real tools. Take words 1 to 11 and the 7 bits of row 12 of sheet E (offline devices; practice words only).

- **SeedSigner 0.8.7:** Main menu > **Tools** > **Calc 12th/24th word** > **12 words** > type words 1 to 11 > **Build Final Word** screen > **Coin flip entropy** > enter the 7 bits (Heads = 1, Tails = 0) > **Next**. It shows the 12th word and the fingerprint. For the address: **Load seed** > **Done**, then the seed's menu > **Address explorer** > **Receive addresses**.
- **VOIDFORGE:** Word draw, same 11 words and 7 bits.

Compare: last word (both tools, and it must be in the 16-word table row from your 7 bits) / fingerprint / first address.

Last word: _____ Fingerprint: _____ First address: _____ Match? yes / no

5. Feedback

Which step was confusing?

_____

Where did you make a mistake (step, what happened)?

_____

Did the forge marks (bias boxes, seal, word check) catch it? yes / no / no mistake

_____

Total time: _____ min Anything else:

_____
